

# Missing data analysis of 2016 Boston marathon data

## Chapter 6: Case studies using hierarchical modelling

Let  $Y_i$  be the speed in mile 26 for runner  $i$  and  $X_{ij}$  be the speed for runner  $i$  in file  $j$ . We fit the linear regression model

$$Y_i = \alpha + \sum_{j=1}^{25} X_{ij} \beta_j + \epsilon_i$$

where  $\epsilon_i \sim \text{Normal}(0, \sigma^2)$ . In these data there are missing  $X_{ij}$ . In our Bayesian analysis we specify a first-order autoregressive prior for the missing (standardized) covariates

$$X_{i1} \sim \text{Normal}(0, \sigma_1^2) \text{ and } X_{ij+1} | X_{ij} \sim \text{Normal}(\rho X_{ij}, \sigma_2^2).$$

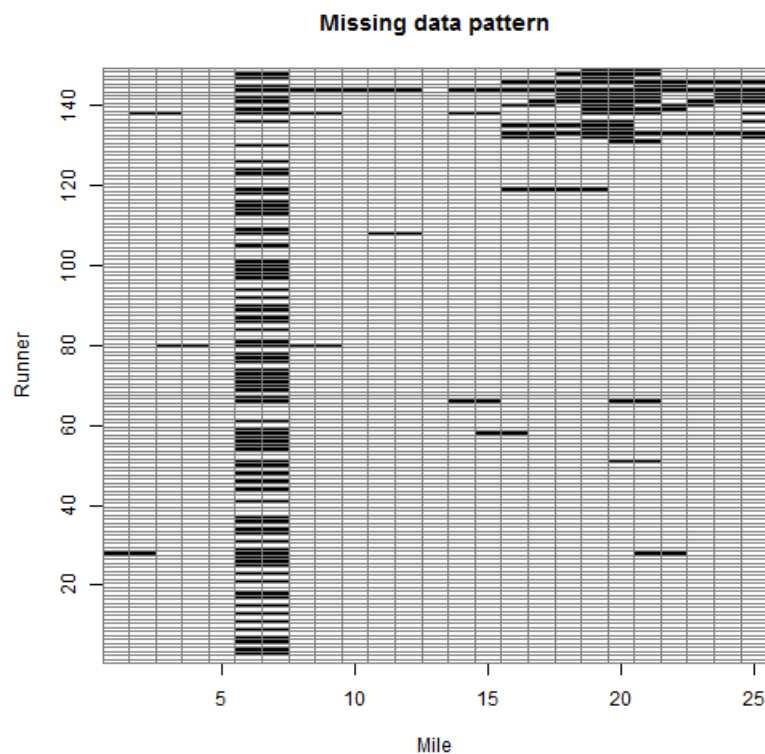

The remaining hyperparameters have uninformative priors.

## Load and plot the data

```
load("BostonMarathon2016.Rdata")

Y <- Marathon_female$SPEED_mile[,26]
X <- Marathon_female$SPEED_mile[,~26]
X <- scale(X)
n <- length(Y)
p <- ncol(X)

image(1:p,1:n,is.na(t(X)),col=0:1,
      xlab="Mile",ylab="Runner",
      main="Missing data pattern")
for(j in 0:p){
  abline(v=j+0.5,col=gray(0.5))
}
for(j in 0:n){
  abline(j+0.5,0,col=gray(0.5))
}
```

```
matplot(t(X),type="l",lty=1,xlab="Mile",ylab="Standardized speed")
```

## Define the model in JAGS

```
library(rjags)
```

```
## Loading required package: coda
```

```
## Linked to JAGS 4.2.0
```

```
## Loaded modules: basemod,bugs
```

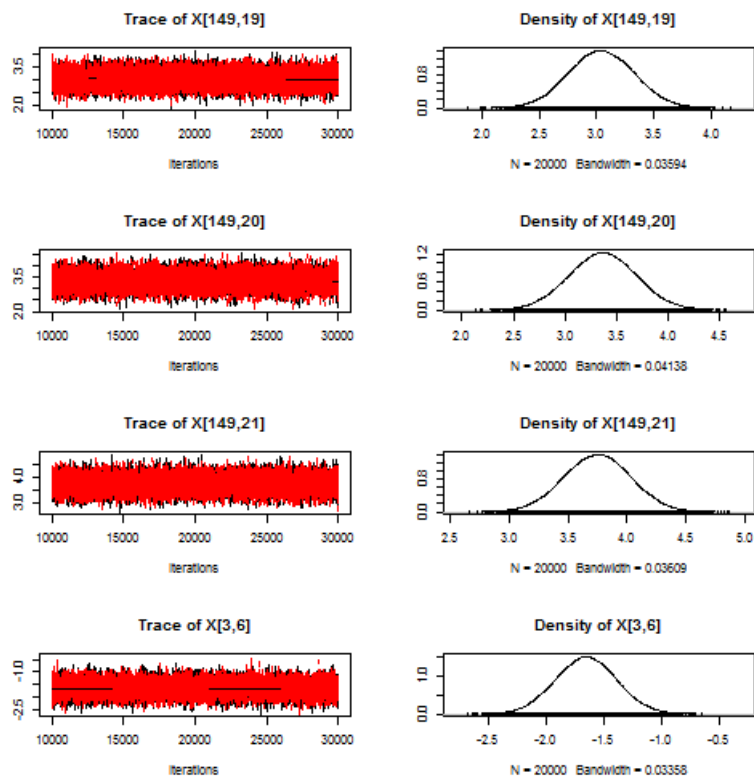

```
model_string <- textConnection("model{  
  
  # Likelihood  
  for(i in 1:n){  
    Y[i] ~ dnorm(alpha + inprod(X[i,],beta[]),taue)  
  }  
  
  # Missing data model  
  for(i in 1:n){  
    X[i,1] ~ dnorm(0,tau1)  
    for(j in 2:p){  
      X[i,j] ~ dnorm(rho*X[i,j-1],tau2)  
    }  
  }  
  
  # Priors  
  alpha ~ dnorm(0,0.01)  
  for(j in 1:p){  
    beta[j] ~ dnorm(0,0.01)  
  }  
  taue ~ dgamma(0.1, 0.1)  
  tau1 ~ dgamma(0.1, 0.1)  
  tau2 ~ dgamma(0.1, 0.1)  
  rho ~ dnorm(0, 0.01)  
}")
```

## Fit the model

```
inits <- list(rho=rnorm(1))
data <- list(Y=Y,X=X,n=n,p=p)
model <- jags.model(model_string,data = data, quiet=TRUE,inits=inits, n.chains=2)

update(model, 10000, progress.bar="none")
params <- c("alpha","beta","X[3,6]","X[3,7]",
            "X[149,19]","X[149,20]","X[149,21]","rho")
samples <- coda.samples(model,
                        variable.names=params,
                        n.iter=20000, progress.bar="none")

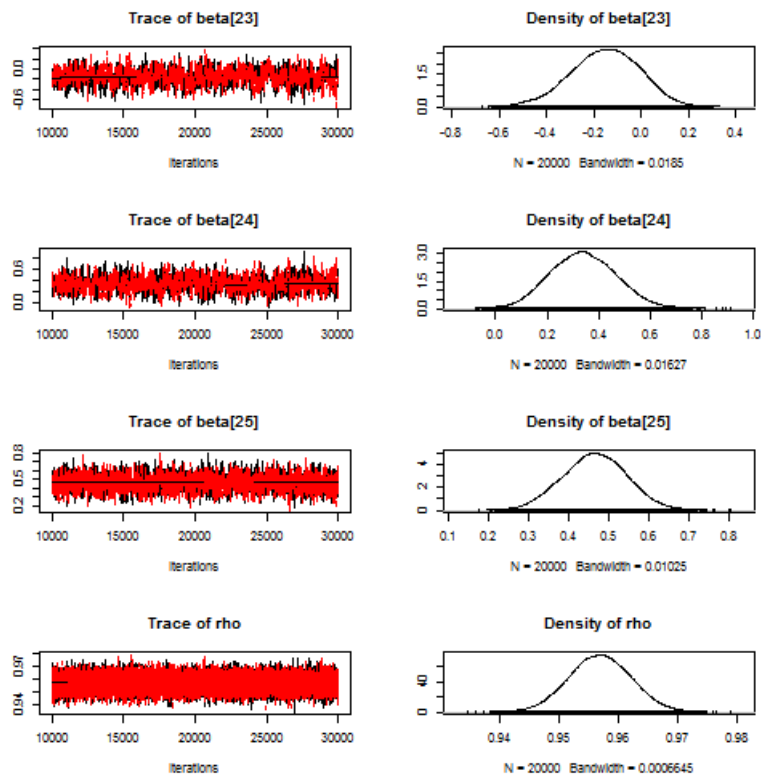

plot(samples)
```

## Plot the imputed covariates for two runners

```
X_miss <- rbind(samples[[1]],samples[[2]]),1:5]
r      <- range(na.omit(as.vector(X)))

# Runner 3
plot(X[3,],ylim=r,
      xlab="Mile",ylab="Speed (minute/mile)",
      main="Imputed X for two runners")
boxplot(X_miss[,4],at=6,outline=FALSE,add=TRUE)
boxplot(X_miss[,5],at=7,outline=FALSE,add=TRUE)

# Runner 149
points(X[149,],pch=19)
boxplot(X_miss[,1],at=19,col=1,outline=FALSE,add=TRUE)
boxplot(X_miss[,2],at=20,col=1,outline=FALSE,add=TRUE)
boxplot(X_miss[,3],at=21,col=1,outline=FALSE,add=TRUE)

legend("topleft",c("Runner 3","Runner 149"),pch=c(1,19),bty="n",cex=1.5)
```

**Summary:** The posterior of the missing  $X_{ij}$  is similar to adjacent speeds.

## Plot the posterior of beta

```
beta <- rbind(samples[[1]],samples[[2]])[,1:p+6]

boxplot(beta,xlab="Mile",ylab="Posterior",
        main="Posterior of beta",
        ylim=1.5*c(-1,1),outline=FALSE,axes=FALSE)
axis(1)
axis(2)

abline(0,0)
```

**Summary:** Only the speed for miles 24 and 25 are significant predictors of the speed in the final mile.
